NIBLS, Inc. — Quant Research & Development Pre-Pilot Proposal

Tech+Ball at NIBLS, Inc.:

10 Institutional Hedge Fund Strategy Partnership Scenarios

Author & Founder: Dashawn Ramel Bledsoe, Founder & Business Executive

Prepared For: Institutional Investors, Quantitative Trading Firms, Hedge Fund Partners

Document Date: July 2026

Entity: NIBLS, Inc. | EIN: 82-3957690

Headquarters: Queens, NY, United States

Website: niblscoin.com | niblsclub.minisite.ai

Research Repository: github.com/dr-b-apes/research-blei-e

DOCUMENT NOTICE:

This proposal outlines 10 specific institutional partnership scenarios, each featuring a named financial institution category, strategy archetype,

BLEI-E

instrument suite, expected alpha generation mechanism, and partnership terms. This document is prepared for qualified institutional investors and accredited professional counterparties only. It does not constitute a public offering of securities. All projected performance figures are forward-looking estimates based on modeled assumptions and are not guaranteed.

EXECUTIVE SUMMARY

Executive Summary

NIBLS, Inc. (National Intelligent Blockchain League Sport / National Ice Ball League Sport, Inc.) introduces the world's first **Biometric-Equity Marketplace** through the **BLEI-E** (Biometric Linked Equity Index) Exchange — a proprietary financial infrastructure platform that securitizes real-time human physiological performance into tradable institutional-grade instruments.

This Pre-Pilot Proposal invites **ten categories of institutional partners** to co-develop and validate quantitative trading strategies using NIBLS's unique and unprecedented data ecosystem. The NIBLS data universe comprises the following core layers:

- Real-time biometric performance telemetry from **Tech+Ball** hardware (1000Hz polling)
- Intrinsic Value Indices: **B-IVI** (Biometric), **F-IVI** (Fatigue), **N-IVI** (NIL), **S-IVI** (Stadium)
- Tradable instruments: **TET** (Team Equity Tokens), **PEI** (Player Equity Instruments), **SEI** (Stadium Equity Instruments), NIL Derivatives, and **DBBI** (Dashawn Bledsoe Bond Index)
- The **BIM-APES** matching engine delivering sub-10ms execution infrastructure

Each of the 10 partnership scenarios has been designed to deliver **uncorrelated alpha** by exploiting an orthogonal data dimension never before available to institutional markets: human physiological performance, securitized in real time. This is not a theoretical construct — NIBLS's **QAI Lab** (Quantum Athletic Intelligence Lab) has developed biometric index methodologies validated against real franchise data (see the NY Knicks 2026 NBA Finals Case Study, available in the NIBLS GitHub research repository).

The pre-pilot program targets a **6-month validation period**. Each institutional partner contributes capital, quantitative research talent, and regulatory co-navigation expertise. NIBLS contributes proprietary hardware, live biometric data feeds, BLEI-E index access, and full exchange infrastructure.

The program is structured to achieve the following outcomes:

- Independent validation of BLEI-E as an institutional-grade alpha factor
- Co-registration for ATS (Alternative Trading System) designation with the SEC
- Live demonstration of uncorrelated Sharpe ratios ranging from **1.4 to 5.0+** depending on strategy archetype
- Establishment of the foundational liquidity and credibility architecture for the NIBLS public exchange

"The BLEI-E ecosystem delivers something no traditional quant fund has ever accessed: a live, continuous, securitized physiological signal stream from elite human athletic performance — orthogonal to equities, fixed income, commodities, and crypto. This is the next institutional alpha frontier."

— *Dashawn Ramel Bledsoe, Founder*

&

Business Executive, NIBLS, Inc.

The financial framework is calibrated for institutional scale. Capital commitments range from **\$2M (research partnership)** to **\$50M (proprietary systematic capital)** across the ten scenarios. Revenue sharing during the pilot period is structured at **60% NIBLS / 40% partner**. Post-pilot licensing, equity conversion options, and long-term preferred partner arrangements are available for strategic counterparties.

NIBLS's long-term financial projections are substantial: annual income targets of **\$31.8M+**, projected pro game income of **\$1.83B**, and a Pre-IPO equity raise targeting **\$200M–\$1B** at valuations ranging from \$382M to \$20B+ depending on stadium infrastructure basis.

SECTION 1

Section 1: BLEI-E Data Ecosystem Overview

1.1 The BLEI-E Data Layer

The **BLEI-E** (Biometric Linked Equity Index) Exchange is built upon a multi-layered, proprietary data collection infrastructure that aggregates physiological, kinetic, environmental, and contractual data streams in real time. The following components constitute the BLEI-E data foundation:

Data Source	Technology	Key Signals	Latency
Tech+Ball Telemetry	Embedded ball sensor array	Impact force, spin rate, pass velocity, spatial trajectory	<10ms
BLEI Wearables	On-athlete biosensors	HRV RMSSD, VO2 max proxies, acceleration counts, neuromuscular fatigue indicators	<10ms
Smart-Gate Fan HRV Sensors	Stadium entry biometric gates	Crowd kinetic energy, decibel thresholds, Fan Velocity Score, collective physiological arousal	<50ms

Data Source	Technology	Key Signals	Latency
NIL Contract Data Feeds	API — talent agency & sponsor integrations	NIL contract value, sponsor brand lift, social engagement metrics	Near real-time
Edge-Computing Stadium Nodes	On-premises compute infrastructure	Pre-processed biometric index calculations, federated model inference	<10ms

The **Tech+Ball** hardware polls biometric and kinetic data at **1000Hz** — a polling rate exceeding any commercially deployed sports telemetry system in institutional use as of 2026. Edge-computing stadium nodes ensure that raw data is pre-processed locally with latency below 10 milliseconds before transmission to the BLEI-E central factor engine, enabling real-time index calculation and instrument repricing.

1.2 Intrinsic Value Indices (IVI Framework)

The **IVI Framework** is NIBLS's proprietary multi-factor index system that converts raw biometric and contextual data into tradable financial signals. Four composite indices constitute the IVI Framework:

Index	Full Name	Core Inputs	Financial Analogy
B-IVI	Biometric Intrinsic Value Index	Explosive movement capacity, aerobic base, precision mechanics, acceleration burst frequency	Earnings quality factor (value factor analog)
F-IVI	Fatigue Intrinsic Value Index	Biological asset depreciation: cortisol proxies, HRV drops >15% from baseline, neuromuscular load accumulation	Credit deterioration / distress signal
N-IVI	NIL Intrinsic Value Index	Nielsen IQ consumer data, social media engagement velocity, sponsor brand lift, endorsement contract value	Brand equity / intangible asset factor
S-IVI	Stadium Intrinsic Value Index	Event revenue density, attendance capacity utilization, broadcast visibility index, in-venue revenue per fan	Real estate yield / NOI factor (REIT analog)

Each IVI is calculated continuously using NIBLS's proprietary factor engine. All four indices are available to Tier 2 and Tier 3 data access partners (see Section 5.3 for data access tier definitions).

1.3 BLEI-E Factor Engine Weights

The **BLEI-E Master Factor Engine** aggregates all four IVI indices into composite instrument valuations using the following baseline factor weights. These weights are dynamically adjusted during live trading windows and are available for partner customization under Tier 3 access:

Factor	Index	Baseline Weight	Rationale
Biometric Performance	B-IVI	40%	Primary alpha signal — direct physiological performance quality
Fatigue / Injury Risk	F-IVI	25%	Leading indicator for asset depreciation and downside risk
Stadium / Venue Economics	S-IVI	25%	Macro context — attendance and revenue environment
NIL Volatility	N-IVI	10%	Tail risk and sentiment modifier — reputational event exposure

1.4 Tradable Instruments Available to Partners

The BLEI-E Exchange offers the following institutional-grade instruments, each underpinned by real-time IVI data feeds. All instruments are available for partner trading during the pre-pilot program subject to applicable regulatory exemptions:

- **TET (Team Equity Tokens):** Dynamic franchise valuation index tokens. Price reflects the composite BLEI-E score of all athletes on a team roster. Analogous to a publicly traded franchise equity, repriced continuously during live events.
- **PEI (Player Equity Instruments):** Individual athlete career trajectory securitization. Each PEI is priced using a weighted combination of B-IVI (performance quality) and F-IVI (longevity/depreciation risk). Analogous to a single-name credit instrument on a human asset.
- **SEI (Stadium Equity Instruments):** REIT-like biometric-adjusted venue instruments. S-IVI feeds directly into SEI pricing. Generates yield-like returns in high-attendance environments.
- **NIL Derivatives:** Sponsor/athlete reputational risk hedges. Constructed from N-IVI signals. Enable institutional hedging of NIL contract exposure and brand risk.
- **DBBI Bonds (Dashawn Bledsoe Bond Index):** Biometric-collateralized debt instruments rated from AAA (stable, high-B-IVI, low-F-IVI athletes) to High-Yield (volatile or injury-prone athletes). DBBI bonds offer fixed coupon with biometric-linked principal adjustments.
- **ALT Team Tokens:** Real-time in-game economy tokens enabling micro-duration positions during active game windows. Designed for HFT strategies with sub-minute holding periods.

Section 2: Pre-Pilot Program Structure

2.1 Program Duration

The NIBLS pre-pilot program runs for a structured **6-month validation period** beginning upon LOI (Letter of Intent) execution by each institutional partner. The 6-month period is subdivided into three operational phases:

Phase	Months	Primary Objectives
Phase I — Integration	Months 1–2	API integration, data normalization, regulatory filing preparation, team onboarding
Phase II — Live Pilot	Months 3–5	Live strategy deployment on BLEI-E instruments, alpha generation measurement, data quality feedback loops
Phase III — Validation	Month 6	Independent performance audit, regulatory submission, post-pilot term sheet negotiation

2.2 Partner Contributions

Each institutional partner is expected to contribute the following resources to the pre-pilot program:

- **Capital Commitment:** Minimum \$500,000 per partner (scenario-specific minimums detailed in Section 4)
- **Quantitative Research Talent:** 1–2 dedicated researchers with experience in alternative data, factor modeling, or high-frequency strategies
- **Regulatory Co-Navigation:** Active engagement with NIBLS's legal team on ATS designation, Reg D structuring, and BIPA/GDPR compliance
- **Data Quality Feedback:** Systematic reporting on API performance, signal quality, and latency benchmarking

2.3 NIBLS Contributions

NIBLS, Inc. contributes the following resources to each institutional partnership during the pre-pilot period:

- Proprietary real-time biometric data feeds (Tier 2 or Tier 3 access as negotiated)
- Full BLEI-E index access across all four IVI dimensions
- **BIM-APES** execution infrastructure with dedicated low-latency API endpoints
- Dedicated integration support team (onboarding, SDK documentation, troubleshooting)
- Revenue sharing on all pilot-period trading P&L (60% NIBLS / 40% partner)
- Historical biometric datasets for backtesting and model validation

2.4 Success Metrics

The pre-pilot program will be evaluated against the following quantitative success metrics at the end of Month 6:

- **Alpha Generation:** Positive alpha vs. traditional sports equity baselines (e.g., sports franchise equity indices)
- **Sharpe Ratio:** Strategy-specific Sharpe ratio benchmarked against respective traditional strategy equivalents
- **Biometric Signal Accuracy:** $R^2 \geq 0.65$ for B-IVI and F-IVI predictive models vs. observed outcome data
- **Regulatory Framework Validation:** Completion of SEC ATS pre-filing and Reg D instrument structuring

2.5 Partnership Terms

Pre-Pilot Partnership Term Framework

- **Revenue Sharing:** 60% NIBLS / 40% Partner on all trading P&L generated using BLEI-E data during pilot period

- **Post-Pilot Transition:** Negotiated exclusive or preferred data licensing agreements based on pilot performance
- **Equity Conversion:** Partners may convert up to 50% of pilot capital commitment to NIBLS Pre-IPO equity at the \$382M valuation cap
- **Exclusivity Windows:** Strategic partners receive 24-month first-mover exclusive data terminal access in their category
- **Data Licensing Post-Pilot:** Enterprise pricing: \$25,000–\$150,000 per data terminal seat annually (Bloomberg Terminal-equivalent)

SECTION 3

Section 3: Partnership Scenario Comparison Summary

The following table provides an at-a-glance comparison of all 10 institutional partnership scenarios detailed in Section 4. Sharpe ratios and return projections are modeled estimates based on NIBLS backtesting and historical biometric proxy data. They are not guaranteed.

#	Institution	Category	Strategy Archetype	Key Instruments	Capital Commitment	Expected Sharpe / Return
1	JP Morgan Asset Management	Bulge Bracket / Asset Manager	Biometric Long-Short Equity	TET, PEI	\$10M minimum	Sharpe 1.8–2.4
2	Morgan Stanley Investment Management	Bulge Bracket / Alternatives	Biometric Event-Driven Arbitrage	PEI, NIL Derivatives, DBBI	\$15M	Sharpe 2.1–3.0
3	Goldman Sachs Quantitative Strategies	Bulge Bracket / Quant Division	Multi-Factor Biometric Alpha Model	Full Suite: TET, PEI, SEI, DBBI, NIL	\$25M	Sharpe 2.5–3.5

#	Institution	Category	Strategy Archetype	Key Instruments	Capital Commitment	Expected Sharpe / Return
4	Sports Data Labs (SDL)	Sports Analytics Provider	Biometric Alpha Research & Validation	B-IVI, F-IVI raw feeds, TET analytics	\$2M research grant + data sharing	Third-party validation value
5	Two Sigma Investments	Systematic Quant Hedge Fund	HFT Biometric Signal Trading (BIM-APES)	TET, ALT Team Tokens, real-time streams	\$20M HFT deployment	Sharpe 3.0–5.0
6	Renaissance Technologies	Secretive Systematic Quant Fund	Medallion-Style Biometric Pattern Recognition	Full BLEI-E historical + real-time series	\$50M proprietary capital	Sharpe 4.0+ (est.)
7	Citadel LLC	Multi-Strategy / Market Maker	Biometric Market Making + Volatility Arb	TET, PEI options, DBBI , NIL Derivatives	\$30M market-making + \$10M arb book	\$5–15M est. annual P&L
8	Bridgewater Associates	Macro / All Weather Fund	Biometric All-Weather Portfolio + Macro Overlay	SEI, DBBI , NIL Volatility Index	\$40M All Weather sleeve	Sharpe 1.4–2.0
9	D.E. Shaw Group	Computational Finance / Systematic	Biometric Stat-Arb + Cross-Asset Factor Model	TET, PEI, B-IVI raw factors	\$15M systematic book	Sharpe 2.2–3.2
10	Family Office / Emerging Market Sports Fund	Family Office / Impact / EM Sports Fund	Long-Only Biometric Growth + Sports Diplomacy Impact	Full suite + international Club TET , NIBLS Pre-IPO equity	\$5M–\$200M (tier-dependent)	10x–50x TET appreciation + Pre-IPO upside

SECTION 4

Section 4: 10 Institutional Hedge Fund Partnership Scenarios

The following ten scenarios represent calibrated, archetype-specific partnership proposals. Each scenario is structured around the institutional partner's existing strategic strengths, technology infrastructure, and regulatory standing. All projected performance metrics are modeled estimates

derived from NIBLS backtesting frameworks and historical biometric proxy data. None constitute guaranteed returns.

Scenario 01 of 10

JP Morgan Asset Management

Bulge Bracket Investment Bank / Asset Manager | Biometric Long-Short Equity

Capital Commitment	Key Instruments	Expected Sharpe	Baseline Sharpe
\$10M Minimum	TET & PEI	1.8 – 2.4	0.9 (Traditional)

PARTNERSHIP CATEGORY & STRATEGY

JP Morgan Asset Management enters the NIBLS pre-pilot as a **Bulge Bracket anchor partner**, deploying a **Biometric Long-Short Equity** strategy against **Team Equity Tokens (TET)** and **Player Equity Instruments (PEI)**.

ALPHA GENERATION MECHANISM

JP Morgan's quantitative equity team deploys a biometric long-short strategy against **Team Equity Tokens**. The mechanism operates on two signal legs:

- **Long Signal:** Long positions initiated when **B-IVI** exceeds the 85th percentile for a team in the 14 days preceding a playoff game. This signal identifies teams whose physiological preparedness is underpriced by current **TET** market valuations, exploiting information asymmetry between real-time biometric data and delayed market repricing.
- **Short Signal:** Short positions triggered when **F-IVI** signals fatigue accumulation exceeding a 15% HRV baseline deviation in key players. This signal predicts statistically significant underperformance probability, enabling profitable **PEI** short positions before official injury announcements or visible performance decline.

The strategy's core alpha thesis rests on a structural market inefficiency: existing sports equity pricing mechanisms rely on lagged statistical data (box scores, win/loss records), while NIBLS's **B-IVI** and **F-IVI** provide continuous physiological signals that reprice the underlying asset quality in real time.

TECHNOLOGY INTEGRATION

JP Morgan's existing **Athena quantitative platform** integrates with the BLEI-E REST API. Biometric data normalization is handled through JP Morgan's existing Hadoop infrastructure, requiring minimal new engineering investment. NIBLS provides dedicated integration engineering support and standardized data schema documentation.

REGULATORY PATHWAY

Joint SEC filing for **TET** as an Alternative Investment Fund instrument. BIPA (Biometric Information Privacy Act) consent protocols co-drafted between JP Morgan's compliance division and NIBLS legal counsel. JP Morgan's institutional SEC relationships are expected to accelerate NIBLS's ATS designation timeline.

PARTNERSHIP VALUE EXCHANGE

JP Morgan's institutional credibility as the **launch anchor partner** is the single most impactful external validation available to NIBLS in 2026. In exchange, NIBLS provides JP Morgan with first-mover **exclusive data terminal access for 24 months** — positioning their quant desk as the leading institutional authority on biometric equity trading before market competition emerges.

Scenario 02 of 10

Morgan Stanley Investment Management

Bulge Bracket / Alternatives Division | Biometric Event-Driven Arbitrage

Capital Commitment	Key Instruments	Expected Sharpe	Arb Window
\$15M	PEI, NIL Derivatives, DBBI	2.1 – 3.0	12–40 Seconds

PARTNERSHIP CATEGORY & STRATEGY

Morgan Stanley Investment Management (Alternatives Division) enters as an **Event-Driven Arbitrage** partner, exploiting latency differentials between real-time on-field biometric events and delayed BLEI-E instrument repricing.

ALPHA GENERATION MECHANISM

Morgan Stanley's event-driven desk exploits a structural latency arbitrage: on-field biometric events are transmitted via **BIM-APES** at sub-10ms latency, while **PEI** instrument repricing on the NIBLS exchange follows with a 12–40 second lag during live events. The arbitrage operates on two concurrent desks:

- **Biometric Latency Arbitrage Desk:** When a player exceeds the 95th percentile acceleration burst (detected via BLEI wearables), **BIM-APES** signals **PEI** repricing before the broader market fully reflects this in token price. Morgan Stanley executes long **PEI** positions within the 12–40 second repricing window, then exits as price converges.
- **NIL Derivatives Injury Hedge Desk:** **F-IVI** signals are used as leading indicators of injury risk — triggering NIL Derivatives short positions before any official injury announcement, enabling profitable hedging of sponsor exposure to athlete health events.

TECHNOLOGY INTEGRATION

Morgan Stanley's **Fortress platform** is extended for high-frequency execution against the **BIM-APES** matching engine via a dedicated low-latency API endpoint. NIBLS provides FIX protocol adaptation documentation and co-location options within NIBLS's edge-computing infrastructure.

REGULATORY PATHWAY

ATS designation co-registration is the primary regulatory workstream. **DBBI** instruments are structured as convertible notes under **Reg D** exemptions, allowing deployment during the pilot period prior to full SEC registration. Morgan Stanley's securities counsel leads the Howey Test analysis for **PEI** instrument classification.

PARTNERSHIP VALUE EXCHANGE

Morgan Stanley's **Prime Brokerage** capability unlocks a breakthrough new revenue line: athlete **PEI** margin lending. By providing prime brokerage services against **PEI** collateral, Morgan Stanley enables NIBLS to offer institutional leverage on biometric equity positions — dramatically expanding the addressable trading volume on the BLEI-E exchange from Day 1.

Scenario 03 of 10

Goldman Sachs Quantitative Strategies

Bulge Bracket / Quant Division | Multi-Factor Biometric Alpha Model

Capital Commitment	Key Instruments	Expected Sharpe	Portfolio Size
\$25M	Full Suite (TET, PEI, SEI, DBBI, NIL)	2.5 – 3.5	60-Asset PEI Portfolio

PARTNERSHIP CATEGORY & STRATEGY

Goldman Sachs Quantitative Strategies (GSQS) enters as the most comprehensive quant partner, deploying a proprietary **Multi-Factor Biometric Alpha Model** across the full BLEI-E instrument suite.

ALPHA GENERATION MECHANISM

Goldman Sachs Quantitative Strategies builds a proprietary multi-factor model incorporating all four IVI indices (**B-IVI**, **F-IVI**, **N-IVI**, **S-IVI**) as alpha factors. The model architecture includes:

- **Factor Engine:** Dynamic factor exposures rebalanced every 4 hours using gradient-boosted tree machine learning models trained on NIBLS biometric historical data
- **Asset Universe:** A 60-asset **PEI** portfolio optimized to minimize intra-league biometric correlation while maximizing exposure to independent physiological alpha signals
- **Volatility Surface Modeling:** Each athlete is treated as a micro-asset with its own implied volatility surface, derived from the historical distribution of their biometric readings relative to their baseline
- **Cross-Instrument Overlay:** **TET**, **SEI**, and **DBBI** positions are used to express macro views on league-wide biometric trends and hedge idiosyncratic **PEI** risk

TECHNOLOGY INTEGRATION

Goldman's **SecDB platform** is extended with a dedicated BLEI-E factor module. Real-time data is ingested via a NIBLS Analytics subscription equivalent to Bloomberg Terminal-level access. Zero-knowledge proof implementation is co-developed for institutional biometric data access — ensuring privacy compliance without sacrificing signal fidelity.

REGULATORY PATHWAY

Full ATS co-registration is Goldman's primary regulatory contribution. Goldman's compliance division leads the **Howey Test** analysis for **TET** and **PEI** instrument classification — a workstream critical for NIBLS's long-term public exchange ambitions. Goldman also co-develops the zero-knowledge proof architecture for institutional data access, setting a privacy-preserving precedent for the entire BLEI-E ecosystem.

PARTNERSHIP VALUE EXCHANGE

Goldman Sachs's quant research publication capacity is uniquely valuable to NIBLS. A peer-reviewed publication validating **BLEI-E** as an institutional-grade alpha factor would unlock **global academic and regulatory credibility** — transforming NIBLS from a startup exchange into a recognized asset class innovator. This credibility cascade is estimated to be worth multiples of the \$25M capital commitment in enterprise value to NIBLS.

Scenario 04 of 10

Sports Data Labs (SDL)

Sports Analytics Data Provider | Biometric Alpha Research & Data Validation

Capital Commitment	Key Instruments	Primary Value	Validation Target
\$2M Research Grant + Data Sharing	B-IVI, F-IVI Raw Feeds, TET Analytics	3rd-Party Validation	R ² ≥ 0.65

PARTNERSHIP CATEGORY & STRATEGY

Sports Data Labs (SDL) — the leading sports analytics firm with established data partnerships across the NFL, NBA, NHL, and college football — enters as NIBLS's independent validation partner. SDL does not deploy trading capital; instead, SDL's research partnership provides the **critical third-party data quality endorsement** that makes all other institutional partnerships possible.

RESEARCH & VALIDATION MECHANISM

SDL co-develops the **BLEI-E Validation Methodology** through the following research workstreams:

- **Benchmark Comparison:** SDL provides comparative datasets from their existing tracking systems (PFF equivalents, Next Gen Stats-equivalent proprietary data) to benchmark NIBLS biometric data quality against existing market standards
- **Predictive Accuracy Validation:** SDL's research team validates the predictive accuracy of **B-IVI** and **F-IVI** signals against outcome data (game results, injury incidence, performance metrics) — targeting R² ≥ 0.65

- **Independent Third-Party Attestation:** SDL authors a signed validation report suitable for submission to the SEC as part of NIBLS's ATS designation application
- **Regulatory Whitepaper Co-Authorship:** SDL's existing sports data licensing frameworks are adapted for NIBLS biometric exchange compliance, and SDL co-authors regulatory whitepapers for SEC submission

TECHNOLOGY INTEGRATION

SDL's existing cloud infrastructure (AWS S3/Redshift) integrates directly with NIBLS edge-computing stadium nodes. Joint API development creates a cross-platform biometric analytics layer that benefits both organizations' product ecosystems.

PARTNERSHIP VALUE EXCHANGE

SDL's validation is the **critical third-party endorsement** that enables NIBLS to approach the SEC for ATS designation with institutional confidence. For SDL, this partnership opens an entirely new market vertical: financial institutions, which represent a dramatically higher-value customer segment than their current sports organization client base. SDL's **BLEI-E validation seal** becomes a new product line unto itself.

Scenario 05 of 10

Two Sigma Investments

Systematic Quantitative Hedge Fund | High-Frequency Biometric Signal Trading (BIM-APES HFT)

Capital Commitment	Key Instruments	Expected Sharpe	Execution Timescale
\$20M HFT Deployment	TET, ALT Team Tokens, Live Biometric Streams	3.0 – 5.0	Milliseconds

PARTNERSHIP CATEGORY & STRATEGY

Two Sigma Investments — one of the world's foremost systematic quantitative funds — enters as the NIBLS HFT (High-Frequency Trading) specialist partner, deploying algorithms directly against the **BIM-APES matching engine** at millisecond timescales.

ALPHA GENERATION MECHANISM

Two Sigma's **Venn data science platform** ingests 1000Hz **Tech+Ball** telemetry streams in real time. Machine learning models — trained on historical biometric sequences from NIBLS pilot events — identify micro-patterns within sub-second data windows:

- **Predictive Score Pattern:** A 3-second biometric window where an athlete's acceleration burst, measured via BLEI wearables, correlates with an estimated 85% probability of a successful 6-point scoring play. Two Sigma executes long **TET** and **ALT Team Token** positions within this window, then exits as token price adjusts post-score.
- **Microstructure Exploitation:** Two Sigma's algorithms map the full order book microstructure of the NIBLS exchange — identifying recurring bid-ask imbalances that precede biometric signal-driven repricing events and profiting from the associated price impact.
- **Cross-Token Correlation Arbitrage:** Exploiting correlated movements between **TET** and **ALT Team Tokens** for the same franchise at millisecond timescales.

TECHNOLOGY INTEGRATION

Two Sigma's **Venn platform** connects to NIBLS edge-computing stadium nodes via **dedicated low-latency fiber**. A co-location arrangement is established within NIBLS stadium infrastructure, minimizing network latency to sub-millisecond levels for Two Sigma's execution algorithms.

REGULATORY PATHWAY

Two Sigma's legal team leads the work to classify NIBLS BIM-APES HFT activity under SEC Market Regulation AT equivalent frameworks as applied to new digital asset classes — establishing regulatory precedent for biometric equity HFT that benefits the entire NIBLS partner ecosystem.

PARTNERSHIP VALUE EXCHANGE

Two Sigma's co-location infrastructure investment **directly funds NIBLS stadium technology build-out**. More critically, Two Sigma's HFT volume generates the continuous exchange liquidity that is the essential prerequisite for attracting retail participants and additional institutional partners to the BLEI-E exchange — solving the cold-start liquidity problem that challenges all new exchanges.

Capital Commitment	Key Instruments	Expected Sharpe (Est.)	Methodology
\$50M Proprietary Capital	Full BLEI-E Dataset (Historical + Real-Time)	4.0+ (Pre-Fees, Est.)	Hidden Markov, Non-Parametric Stat

PARTNERSHIP CATEGORY & STRATEGY

Renaissance Technologies — arguably the most successful quantitative fund in the history of finance, known for the Medallion Fund's extraordinary performance record — enters as NIBLS's **signal validation apex partner**. RenTech deploys their signature statistical approach against biometric performance time series.

ALPHA GENERATION MECHANISM

Renaissance Technologies applies their Medallion-style statistical arbitrage methodology to biometric performance series, treating athlete physiological data as a time series with embedded statistical patterns analogous to financial price series:

- **Hidden Markov Models (HMM):** Biometric sequences (HRV, acceleration, fatigue accumulation cycles) are modeled as hidden Markov chains — identifying discrete physiological performance states (peak readiness, early fatigue, acute fatigue, recovery) that predict future **TET** and **PEI** price movements with statistical significance.
- **Non-Parametric Statistical Methods:** RenTech's proprietary non-parametric approach identifies recurring biometric patterns without assumptions about underlying distribution — critical given the novel nature of biometric equity data.
- **Mean-Reversion and Momentum Properties:** Biometric series (HRV cycles, fatigue accumulation/recovery) exhibit mean-reversion properties analogous to volatility mean-reversion in traditional markets. Acceleration burst frequency exhibits momentum properties analogous to price momentum factors.

TECHNOLOGY INTEGRATION

An **air-gapped historical BLEI-E data lake** is provided to RenTech for offline model development — consistent with their security-first approach to proprietary data. Live feed integration is established via an encrypted dedicated channel with dual-layer authentication and hardware security modules.

REGULATORY PATHWAY

Given RenTech's unparalleled regulatory sophistication and track record of navigating novel financial instrument classifications, **Renaissance Technologies leads the partnership in SEC engagement strategy** — an extraordinary value-add beyond the capital commitment.

PARTNERSHIP VALUE EXCHANGE

Strategic Impact Notice

A confirmed Renaissance Technologies involvement signal alone — without any financial details — would be **transformative for NIBLS's institutional credibility and enterprise valuation**. RenTech's participation would signal to every major quant fund globally that the BLEI-E data ecosystem is worthy of serious systematic investigation. This reputational effect is estimated to accelerate NIBLS's institutional adoption curve by 18–24 months.

Scenario 07 of 10

Citadel LLC

Multi-Strategy Hedge Fund + Market Maker | Biometric Market Making + Volatility Arbitrage

Capital Commitment	Key Instruments	Est. Annual P&L	ATS Timeline Benefit
\$30M Market Making + \$10M Arb	TET, PEI Options, DBBI, NIL Derivatives	\$5–15M	–12 to –18 Months

PARTNERSHIP CATEGORY & STRATEGY

Citadel LLC — the world's leading multi-strategy hedge fund and market maker — enters as NIBLS's **exchange liquidity anchor and volatility arbitrageur**. Citadel's dual role solves two critical early-stage exchange challenges simultaneously: liquidity provision and instrument pricing efficiency.

ALPHA GENERATION MECHANISM

Citadel operates two concurrent strategies within the NIBLS partnership:

- **Biometric Market Making:** Citadel's market-making desk provides continuous bid-ask liquidity for **TET** and **PEI** instruments on the NIBLS exchange, earning the bid-ask spread while managing inventory risk using real-time **BLEI-E** signals as delta-hedging inputs. This solves the exchange's critical early-stage liquidity problem and enables retail participant onboarding.
- **DBBI Volatility Arbitrage:** Citadel's Global Fixed Income team runs volatility arbitrage between **DBBI** biometric bonds and traditional credit markets, exploiting the uncorrelated nature of athletic performance cycles relative to macroeconomic credit cycles. During macroeconomic recession periods, **DBBI** AAA bonds (stable, high-B-IVI athletes) are expected to outperform corporate investment-grade credit due to biological cycle decorrelation from business cycles.

TECHNOLOGY INTEGRATION

Citadel's proprietary trading infrastructure connects to the **BIM-APES** matching engine via **FIX protocol adaptation** — Citadel's existing FIX connectivity infrastructure requires minimal modification to integrate with NIBLS's BIM-APES API.

REGULATORY PATHWAY

Citadel's existing **broker-dealer infrastructure** (Citadel Securities) facilitates NIBLS ATS registration under their regulatory umbrella, with the potential to accelerate the NIBLS ATS designation timeline by **12–18 months** compared to a standalone filing — an extraordinary regulatory efficiency that directly benefits NIBLS's time-to-market for all other partnerships.

PARTNERSHIP VALUE EXCHANGE

Citadel's continuous market-making presence resolves **exchange liquidity — the number-one prerequisite for attracting retail and additional institutional participants** to the BLEI-E exchange. Without a committed market maker of Citadel's caliber, NIBLS's exchange would face the standard new-exchange cold-start problem. With Citadel as market maker, the exchange opens with institutional-grade liquidity from Day 1.

Scenario 08 of 10

Bridgewater Associates

Macro Hedge Fund / All Weather Strategy | Biometric All-Weather Portfolio + Macro Overlay

Capital Commitment	Key Instruments	Expected Sharpe	Strategy Philosophy
\$40M All Weather Sleeve	SEI, DBBI Bonds, NIL Volatility Index	1.4 – 2.0	All Weather (Low Drawdown)

PARTNERSHIP CATEGORY & STRATEGY

Bridgewater Associates — the world's largest macro hedge fund, known for the **All Weather** portfolio strategy — enters as NIBLS's **macro overlay and institutional channel-opener**. Bridgewater applies their signature balanced portfolio philosophy to biometric equities, constructing a minimum-drawdown biometric-macro hybrid allocation.

ALPHA GENERATION MECHANISM

Bridgewater constructs a **Biometric All-Weather Portfolio** using three BLEI-E instrument classes calibrated to different macroeconomic environments:

- **SEI (Stadium Equity Instruments):** Provides yield-like returns in high-attendance environments. Analogous to real estate / inflation-linked assets in the All Weather framework — performs well in high-inflation, high-growth regimes where consumer spending on live entertainment expands.
- **DBBI Bonds:** Provides biometric-linked fixed income with decorrelated yield characteristics. Performs in disinflationary and risk-off environments where traditional credit spreads widen but athletic performance cycles remain independent.
- **NIL Volatility Index:** Provides growth-like optionality exposure during bull market environments where brand equity and social capital values expand rapidly.

Bridgewater's macro overlay adjusts biometric exposure weights based on macroeconomic regime identification using their proprietary economic machine framework — with **S-IVI** and **DBBI** yield components gaining weight in inflationary regimes and **PEI/TET** growth components dominating in expansion regimes.

TECHNOLOGY INTEGRATION

Bridgewater's **Dot Collector decision-intelligence platform** is adapted to incorporate **BLEI-E** biometric signals as non-financial macro indicators — effectively treating biometric performance trends as a proxy for consumer health, entertainment demand, and human capital vitality within their broader macroeconomic signal universe.

PARTNERSHIP VALUE EXCHANGE

Bridgewater's macro research and institutional distribution network opens the most important downstream channel for NIBLS: **pension funds and endowments**. A Bridgewater research note validating **SEI** and **DBBI** as legitimate asset classes for institutional allocation would open trillion-dollar institutional channels that are inaccessible through direct NIBLS outreach alone.

Scenario 09 of 10

D.E. Shaw Group

Computational Finance / Systematic Quant Fund | Biometric Stat-Arb + Cross-Asset Factor Model

Capital Commitment	Key Instruments	Expected Sharpe	Forward Estimate Window
\$15M Systematic Book	TET, PEI, B-IVI Raw Factors	2.2 – 3.2	72-Hour B-IVI Forward Estimates

PARTNERSHIP CATEGORY & STRATEGY

D.E. Shaw Group — known for pioneering computational approaches to financial markets — enters as NIBLS's **cross-asset quantitative research partner**, deploying a biometric statistical arbitrage strategy alongside a cross-market arbitrage framework that bridges NIBLS instruments and traditional sports markets.

ALPHA GENERATION MECHANISM

D.E. Shaw deploys three concurrent alpha generation mechanisms:

- **Intra-League Biometric Stat-Arb:** A POSIT-style dark pool matching system identifies and executes statistical arbitrage between correlated athlete **PEIs** — specifically pairs of players on the same team whose **B-IVI** patterns are historically correlated but intermittently diverge due to position-specific workload differences. The strategy captures the mean-reversion of spread between correlated PEI pairs.
- **72-Hour B-IVI Predictive Model:** D.E. Shaw's machine learning team builds athlete performance prediction models using biometric sequences as input features, generating 72-hour forward estimates of **B-IVI** values. These serve as alpha signals for **PEI** positioning before upcoming games.

- **Cross-Market Arbitrage:** D.E. Shaw exploits systematic inefficiencies between NIBLS **TET** pricing and traditional sports betting market odds (DraftKings/FanDuel implied probabilities), where BLEI-E biometric signals provide a demonstrably more accurate probability estimate than market-implied odds.

TECHNOLOGY INTEGRATION

D.E. Shaw's **BESS platform** is extended to ingest BLEI-E biometric factor streams via the NIBLS REST API. Joint legal work addresses the regulatory complexities of cross-market arbitrage at the intersection of sports betting regulations and securities exchange rules — a novel legal frontier that D.E. Shaw's sophisticated legal team is uniquely equipped to navigate.

PARTNERSHIP VALUE EXCHANGE

D.E. Shaw's computational research approach advances **NIBLS's own machine learning infrastructure** through shared R&D — effectively providing NIBLS with world-class quant engineering talent that accelerates the development of the BLEI-E factor engine beyond what NIBLS could accomplish independently. The cross-market arbitrage framework also helps establish the legitimate relationship between NIBLS's biometric equities and existing regulated sports markets.

Scenario 10 of 10

Family Office / Emerging Market Sports Fund

Family Office / Impact Investment / Emerging Market Sports Fund | Long-Only Biometric Growth + Sports Diplomacy Impact

Capital Commitment	Key Instruments	Expected Return	Impact Metric
\$5M–\$200M (Tier-Dependent)	Full Suite + International Club TET + NIBLS Pre-IPO Equity	10x–50x TET Appreciation + Pre-IPO Upside	100,000+ Youth Athletes Trained

PARTNERSHIP CATEGORY & STRATEGY

A qualifying **Family Office** or **Emerging Market Sports Impact Fund** enters as NIBLS's international infrastructure and impact investment partner. This scenario is the only long-only strategy in the pre-pilot

program — reflecting the multi-decade investment horizon appropriate for emerging market sports infrastructure and Pre-IPO equity appreciation.

ALPHA GENERATION MECHANISM

The investment thesis rests on three compounding return drivers:

- **International Club TET Appreciation:** Long-only positions in international club **TET** instruments for clubs in high-growth emerging markets — specifically targeting: Eagles (Zambia), Spyda-Bots (Venezuela), Apes (India), Panthers (Mali), Triple Assassins (Korea), and Royals Tech+Ball Club (Japan). These clubs' **TET** valuations are at grassroots-level pricing in 2026 but are expected to experience exponential appreciation as NIBLS's biometric exchange matures and their respective national sports markets expand. The investment thesis mirrors early-stage investments in Asian basketball markets circa 2005, which subsequently generated extraordinary returns as NBA reach expanded.
- **NIBLS Pre-IPO Equity:** Direct equity participation in the NIBLS Pre-IPO at the \$382M valuation cap, with potential appreciation to \$20B+ stadium attendance basis — representing a 50x+ upside scenario for early equity holders.
- **NBL Unity Token Infrastructure:** Investment in NBL Unity Token infrastructure in emerging market regions generates both social impact returns (youth athletic programs) and financial returns as the token ecosystem scales with league growth.

PRE-IPO EQUITY TRANCHE STRUCTURE

Investment Tier	Minimum Investment	Equity Percentage	Interest Rate	Term
Entry Tier	\$50,000	10%	5–8% p.a.	7 years
Growth Tier	\$500,000	15%	5–8% p.a.	7 years
Strategic Tier	\$10,000,000	30%	5–8% p.a.	7 years
Anchor Tier	\$20,000,000	35%	5–8% p.a.	7 years
Founding Partner Tier	\$200,000,000	40–45%	5–8% p.a.	7 years

TECHNOLOGY INTEGRATION & FRANCHISEE MODEL

The family office or fund establishes a **dedicated NIBLS Tech+Ball club** in their home country or target emerging market, providing local biometric data collection infrastructure. The **license-to-own franchisee**

framework offers a 3–5 year equity conversion pathway, transforming the initial franchise license fee into NIBLS equity ownership as league revenue milestones are achieved.

REGULATORY PATHWAY

Emerging market regulatory navigation is handled via local counsel in each target jurisdiction, with NIBLS's New York State corporate structure (Queens, NY) serving as the parent regulatory anchor. This structure has been designed for international scalability from inception.

PARTNERSHIP VALUE EXCHANGE

This partnership provides NIBLS with critical **international club infrastructure capital** while generating outsized returns for the impact investor. The social impact dimension — 100,000+ youth athletes trained through club infrastructure — satisfies the ESG mandates increasingly required by the family offices, sovereign wealth funds, and development finance institutions that represent the most capital-rich emerging market investor base globally.

SECTION 5

Section 5: Partnership Selection Criteria and Process

5.1 Eligibility Requirements

All institutions seeking to participate in the NIBLS pre-pilot program must meet the following minimum eligibility criteria:

Criterion	Minimum Requirement	Rationale
Assets Under Management (AUM)	\$500M minimum	Ensures institutional-grade capital commitment capacity and regulatory standing
Quantitative Research Capability	Existing quant research team (minimum 2 FTE)	Partner must be able to engage substantively with BLEI-E factor methodology
Regulatory Standing	SEC-registered investment adviser or equivalent international regulatory standing	Required for ATS co-registration process and Reg D instrument participation
Technology Infrastructure	Existing capability for REST API integration and real-time data ingestion	Required for BLEI-E data feed and BIM-APES execution connectivity

Criterion	Minimum Requirement	Rationale
Confidentiality	NDA execution prior to data room access	NIBLS proprietary IVI methodology and raw biometric data require institutional confidentiality protections

5.2 Selection Process

The NIBLS pre-pilot partner selection follows a structured five-stage process:

1. **Expression of Interest (EOI):** 30-day open EOI window. Institutions submit a 2-page summary of proposed strategy archetype, technology capabilities, and capital commitment range.
2. **Technical Due Diligence:** NIBLS provides NDA-gated data room access for BLEI-E data quality assessment. Candidate partners evaluate API performance, signal fidelity, and data schema compatibility with their existing infrastructure.
3. **Letter of Intent (LOI) Execution:** Qualified candidates execute a non-binding LOI specifying capital commitment range, strategy archetype, and regulatory co-navigation responsibilities.
4. **6-Month Pilot Agreement:** Full pilot agreement execution, including capital funding, team assignment, and regulatory co-filing commencement. Pilot begins upon agreement execution.
5. **Post-Pilot Term Sheet:** Based on pilot performance metrics, NIBLS and the partner co-negotiate long-term data licensing, equity conversion, and preferred partner terms.

5.3 Data Access Tiers

NIBLS's biometric data is organized into three access tiers to balance proprietary IP protection with institutional partner needs:

Tier	Access Level	Data Available	Eligible Partners
Tier 1 — Public	Aggregated BLEI-E indices (delayed)	Daily IVI summary values, league-level aggregates	All registered users
Tier 2 — Partner	Real-time biometric factor feeds	Live B-IVI, F-IVI, N-IVI, S-IVI per athlete/team; BIM-APES API access	Pre-pilot institutional partners (post-LOI)
Tier 3 — Strategic	Raw 1000Hz telemetry + proprietary IVI calculation methodology	Raw Tech+Ball telemetry, BLEI wearable streams, IVI factor weights, edge-node pre-processed data, co-location access	Strategic partners only (scenarios 3, 5, 6 and negotiated others)

Section 6: Quantitative Research Infrastructure

6.1 QAI Lab — Quantum Athletic Intelligence Laboratory

The **QAI Lab (Quantum Athletic Intelligence Laboratory)** is NIBLS's internal research division, charged with developing and maintaining the intellectual infrastructure of the BLEI-E ecosystem. The QAI Lab's mission is *precision performance through computational intelligence* — bridging the disciplines of sports science, computational finance, and regulatory compliance.

QAI Lab Staffing Model:

Role	Function	Key Deliverable
Data Scientists	IVI factor model development, backtesting	B-IVI, F-IVI, N-IVI, S-IVI calculation engines
Machine Learning Engineers	Predictive model deployment, real-time inference	Gradient-boosted B-IVI predictive models, HMM fatigue classifiers
Biomechanists	Biometric signal interpretation, sensor calibration	Validated B-IVI and F-IVI sensor-to-factor translation protocols
Neuroscientists	HRV methodology, fatigue neuroscience	F-IVI neuromuscular fatigue model validation
Sensor / Hardware Engineers	Tech+Ball hardware, BLEI wearable maintenance	1000Hz telemetry reliability at <10ms latency
Sports Scientists	Performance periodization, recovery modeling	Athlete baseline normalization for IVI calculations

6.2 Historical Data Availability and Backtesting Framework

Available Historical Datasets:

- Tech+Ball game data from NIBLS pilot events (league-level ground-truth biometric records)
- Biometric baseline datasets from collegiate program participants

- The **Biometric Index Market — NY Knicks 2026 NBA Finals Case Study**, demonstrating BLEI-E methodology applied to real franchise data, available in the NIBLS GitHub research repository: github.com/dr-b-apes/research-blei-e

Backtesting Methodology: All 10 partnership scenario performance projections are derived from 3-year simulated BLEI-E backtests using historical sports biometric proxies. The validation framework uses a strict **70/20/10 train/validate/test split** to prevent look-ahead bias and ensure out-of-sample performance estimates are conservative. All Sharpe ratio projections reflect net-of-costs, out-of-sample test set performance only.

6.3 Technology Stack for Partners

Component	Technology	Partner Access Point
Data Security & Compliance	AWS CloudHSM + Blockchain ledger	Encrypted API credentials
Smart Contract Infrastructure	Hyperledger Fabric	Athlete consent smart contracts; instrument lifecycle management
Data Access Interface	RESTful API + SDK (Python, R, Java)	Primary data feed for all Tier 2 and Tier 3 partners
Stadium Data Collection	Edge-computing stadium nodes (<10ms)	Co-location available for Tier 3 HFT partners
Order Matching	BIM-APES matching engine	FIX protocol + proprietary low-latency API
Fixed Income Analytics	DBBI yield curve modeling	DBBI bond pricing API endpoint

SECTION 7

Section 7: Regulatory Roadmap for Partnership

7.1 SEC Registration Timeline

NIBLS's regulatory roadmap is structured as a 12-month phased program, with institutional partner support accelerating each phase:

Phase	Timeline	Regulatory Action	Lead Partner Support
Phase 1	Months 1–2	Broker-Dealer application initiation	Citadel LLC (broker-dealer infrastructure)
Phase 2	Months 3–4	ATS (Alternative Trading System) designation filing	JP Morgan, Goldman Sachs, Renaissance Technologies
Phase 3	Months 5–6	Pilot instruments structured under Reg D exemption	Morgan Stanley (convertible note structuring)
Phase 4	Months 7–12	Full public offering registration (S-1 equivalent)	All anchor partners (co-filing support)

7.2 BIPA / GDPR / CPRA Compliance Framework

Given the biometric nature of NIBLS's core data layer, athlete and fan data privacy compliance is a foundational legal requirement. NIBLS's compliance architecture addresses all applicable frameworks:

- **Athlete Consent Protocols:** Smart contract-based consent management on the Hyperledger Fabric blockchain — explicit, granular, and revocable by the athlete at any time. Consent records are immutable and auditable.
- **Institutional Data Access:** Tier 2 and Tier 3 partner data access is delivered via **zero-knowledge proofs** where applicable — enabling partners to trade on biometric signals without accessing individually identifiable biometric records directly.
- **Fan Data Anonymization:** Smart-Gate fan biometric data (crowd HRV, Fan Velocity Score) is aggregated and anonymized at the edge node before transmission. No individual fan biometric records are retained or transmitted.
- **GDPR (European Partners):** Data processing agreements (DPAs) co-drafted with EU counsel for any European institutional partners.
- **CPRA (California):** NIBLS's data handling practices are designed to comply with the California Privacy Rights Act for California-domiciled athletes and fans.

7.3 NYDFS BitLicense

NIBLS will pursue a **NYDFS (New York Department of Financial Services) BitLicense** to enable the full digital asset / token economy layer of the BLEI-E exchange. Application timeline: **6–9 months** from initiation. NIBLS requests partner co-regulatory support from institutions with existing BitLicense or

equivalent digital asset regulatory standing (e.g., Fidelity Digital Assets, Coinbase's institutional arm) to expedite the NYDFS review process through demonstrated institutional partnership credibility.

SECTION 8

Section 8: Financial Terms and Projections for Partners

8.1 Revenue Sharing During Pilot

During the 6-month pre-pilot period, all trading profit & loss (P&L) generated using NIBLS BLEI-E data is shared on the following basis:

Pilot Period Revenue Share	
Party	
Share of Trading P&L	
Basis	
NIBLS, Inc.	
60%	
Data provision, exchange infrastructure, IP contribution	
Institutional Partner	
40%	
Capital, quant talent, regulatory co-navigation, technology integration	

8.2 Post-Pilot Licensing Options

Upon successful completion of the 6-month pilot, institutional partners have access to the following long-term commercial frameworks:

- **Exclusive Data Terminal Access:** Enterprise data terminal pricing at **\$25,000–\$150,000 per seat annually** (Bloomberg Terminal-equivalent institutional pricing), with exclusivity options available by strategy category for the first 24 months post-pilot.
- **Preferred Partner Status:** First-access rights to all new BLEI-E instrument launches, new IVI indices, and new athlete/team token listings prior to public availability.
- **Co-Development Rights:** Strategic partners with significant post-pilot commitments may negotiate co-development rights on new instrument classes — earning royalty streams on new products derived from the partnership.

8.3 Equity Participation Options and NIBLS Financial Projections

Equity Conversion: Partners may convert up to **50% of their pilot period investment** into NIBLS Pre-IPO equity at the **\$382M valuation cap**. This option must be exercised within 30 days of pilot completion.

NIBLS Financial Projections (Summary):

Financial Metric	Projection	Basis
Annual Operating Income	\$31,843,608	Data licensing, exchange fees, revenue share
Pro Game Income	\$1,828,285,000	Full professional league deployment across 24 clubs
Operating Expenses	\$1,270,106	Technology, operations, and infrastructure
Pre-IPO Capital Raise Target	\$200M – \$1B	Institutional pre-IPO equity offering
Pre-IPO Valuation (Token Distribution Basis)	\$382M	Token distribution and early equity methodology
Long-Term Valuation (Stadium Attendance Basis)	\$20B+	24 clubs × 17,000–80,000 seat stadiums × attendance revenue model

Note on Projections

All financial projections presented in this document are forward-looking estimates based on modeled assumptions about league growth, institutional adoption, and exchange volume. They do

not constitute guarantees of future performance. Prospective partners should conduct independent due diligence and consult their own legal, financial, and regulatory counsel.

CONCLUSION

Conclusion and Call to Action

NIBLS, Inc. represents a singular, time-sensitive opportunity to establish institutional presence in an entirely new asset class — **Biometric Equities** — before this market reaches mainstream awareness and institutional saturation. The 10 partnership scenarios outlined in this proposal are not speculative constructs; they are **precisely calibrated to the specific strategic strengths, technology infrastructure, and regulatory capabilities of each institutional archetype**.

The fundamental investment thesis is as follows:

- **Data Novelty:** The BLEI-E data ecosystem provides access to an orthogonal, uncorrelated signal dimension — human physiological performance, securitized in real time — that has never been available to institutional financial markets before NIBLS.
- **Alpha Durability:** Unlike traditional alternative data sources (satellite imagery, credit card data) that face rapid signal decay as adoption spreads, biometric performance data remains perpetually novel because human athletic performance is itself continuously evolving and unpredictable.
- **Regulatory First-Mover Advantage:** Partners who co-navigate the ATS, Reg D, and BitLicense frameworks with NIBLS now will hold **structural regulatory advantages** — preferred data access, grandfathered licensing terms, and co-development rights — that cannot be replicated by later entrants.
- **ESG and Social Impact Alignment:** The NIBLS platform's youth athlete development mission, international club infrastructure, and biometric health data applications generate measurable social impact metrics that satisfy the ESG mandates increasingly required by institutional LPs —

transforming what is already a compelling financial opportunity into a dual-mandate investment.

The ten institutional archetypes described in this proposal are the founding cohort of what will become the defining new asset class of the next decade. The question is not whether biometric equity markets will be institutionalized — it is who will be at the table when they are.

NIBLS, Inc. invites the ten categories of institutional partners described herein to initiate dialogue. The pre-pilot Expression of Interest window is open for **30 days** from the date of this proposal's distribution. Given the limited number of partnership slots (10 total, one per institutional archetype), NIBLS encourages all interested counterparties to initiate contact immediately.

The next contact for all institutional inquiries, Expression of Interest submissions, and technical due diligence requests is:
